

Phone Sync Gesture Change Proposal

Visual mockup for replacing traffic-police style direction poses with a clearer phone-sync gesture.

1. What should change

The current direction idea depends on static hand shapes. Users may understand it as directing traffic or waving a hand, not syncing a phone from one person to another.

Change target: stop presenting the gesture as a hand-arrow pose. Present it as a sync transfer from one phone/person to another.

2. New visual meaning

Use a phone outline, two-person context, shadow hand, and motion trail arrows. The command is the direction of the hand movement.

Recommended gesture: show open palm near the phone-sync area, then move the whole hand left, right, up, or down. Static finger direction should not be enough.

3. Four direction shadow images

These are the four visual targets I want to use in the app guidance and detector behavior.

Sync Left

Hand shadow moves left between phones.

Sync Right

Hand shadow moves right between phones.

Sync Up

Hand shadow moves upward, not just pointing up.

Sync Down

Hand shadow moves downward, not just pointing down.

4. Exact app changes proposed

Detection change

Before: direction is detected from the way extended fingers point. After: direction is detected from whole-hand movement over time while the palm is visible.

User text change

Before: Moving left, Moving right, Moving up, Moving down. After: Sync left, Sync right, Sync up, Sync down.

Visual change

Before: hand-only shadow or flat arrow-like hand pose. After: shadow hand plus phone outline, person-to-person context, and motion trail arrow.

Keep unchanged

Zoom, recording, face detection, follow-object selection, and camera switching should stay the same. The change is only for the four direction commands.
